DETAILED ACTION

Drawings

The drawings are objected to under 37 CFR 1.83(a). The drawings must show every feature of the invention specified in the claims. Therefore, the actuator recited in claim 34 must be shown or the feature(s) canceled from the claim(s). No new matter should be entered.

A proposed drawing correction or corrected drawings are required in reply to the Office action to avoid abandonment of the application. The objection to the drawings will not be held in abeyance.

Specification

The specification is objected to as failing to provide proper antecedent basis for the claimed subject matter. See 37 CFR 1.75(d)(1) and MPEP § 608.01(o). Correction of the following is required: there is no antecedent basis in the description for “actuator.”

There is no brief description of figs. 10 and 11.

Claim Rejections - 35 USC § 112

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claim 33 is rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

Art Unit: 3763

The recitation of a gas generator of carbon dioxide solution and dry ice was introduced in Paper No. 2, and is new matter to the specification as filed.

Allowable Subject Matter

Claims 29, 31, 32, 34-38 are allowed. The claims are allowed because they recite a syringe including a barrel with a drug reservoir therein, a needle assembly mounted at the first end of the barrel, energization source, and a nozzle sleeve, moveably mounted at the first barrel end that moves within the barrel, the sleeve has a first position concealing the needle, a second position exposing the needle, and an activation position wherein the needle penetrates the injection site when the sleeve moves from the first to the second position and the energization source is activated when the sleeve moves from the second position to the activation position.
